Line guide device

Abstract

A line guide device for guiding lines can comprise a plurality
10 of links, connected to each other in articulated fashion, where
at least some, or all, of the links each display a bottom
element, opposite side walls and at least one cover element,
the plurality of links are integrally moulded on one another in
one piece, forming a continuous strand, and the line guide
15 device can be arranged to form a lower run, a curved section
and an upper run. For the purpose of low-cost manufacture and
versatile utility with comparatively small cross-sections of
the links, it is proposed that the bottom element (3) and both
opposite side walls (4) of the links are designed in one piece
20 as essentially rigid U-sections, and the cover element (5a, 5b)
of the respective link is integrally moulded on at least one
side wall (4) of said link and designed to be moveable, and can
be moved into a position closing the link and a position
releasing it. (Fig. 1b)
